(a) KIT replicate pairs: observed against predicted
observed within the set, d = ln(L_warm / L_cool)
predicted by the between-set lever, p = -s dT
warm band (70 pairs)
cold band (36 pairs)
ring: tied (104 of 106)
beta = 1
fitted, beta = -0.09
95 %: -2.05 to +1.37
(b) what the replicates could detect
smallest |s| detectable at 80 % power (% per K)
replicate pairs at the observed dT spread
against the KIT floor
against the Geslin floor
the pairs available: calculated
simulated, log-normal floor
warm band median, 1.30 % per K
cold band median, 3.58 % per K
ticks at the edge: KIT between-set |s|, by band
KIT pairs, dT 0.44 K rms
Sandia pairs, dT 1.54 K rms
